

World Famous Professor, Pathologist, & Electron Microscopist Supports Conclusions of *Virus Mania*

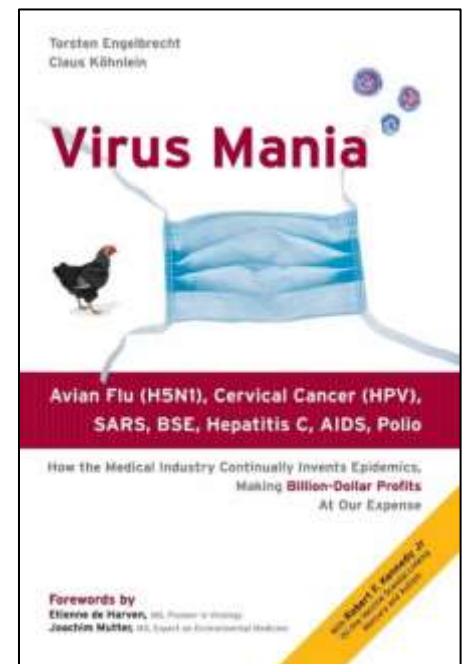

Étienne de Harven MD (1928-2019) was a Belgian-born pathologist and electron microscopist. He did pioneering research on viruses, mostly related to murine leukemia.

He was the President of the Electron Microscopy Society of America, Professor Emeritus of Pathology at the University of Toronto Member of the Sloan Kettering Institute for Cancer Research, New York (1956 - 1981); Member of Thabo Mbeki's AIDS Advisory Panel of South Africa and President of Rethinking AIDS (www.rethinkingaids.com)

From the Foreword by Dr. Étienne de Harven:
“... scientific research on viruses (or prions in the case of BSE) slipped onto the wrong track following basically the same systematic pathway. This pathway always includes several key steps:

- **inventing** the risk of a disastrous epidemic,
- **incriminating** an elusive pathogen,
- **ignoring** alternative toxic causes,
- **manipulating** epidemiology with non-verifiable numbers to maximize the false perception of an imminent catastrophe, and
- **promising salvation with vaccines.**

This guarantees large financial returns.”
